

## Tasks

- 1) Display the data from a database in a html table using php
- 2) Create a drop down list in html where the content should come from a database table.
- 3) Create a form which takes "id" from user and then delete the record from database. Once the user press "delete" button, he gets redirected to another page with message "record deleted successfully" and the updated table content is shown.
- 4) Repeat task three but this time for "update" operation.
